## Executive Summary

This report presents the findings of the second territory-wide food consumption survey (Survey) conducted in Hong Kong in 2018-2020 to investigate the food consumption of Hong Kong adults aged 18 or above. Policy 21 Limited was commissioned by the Food and Environmental Hygiene Department (FEHD) to provide the service for conducting the Survey for the Centre for Food Safety (CFS) to obtain up-to-date food consumption information and facilitate its risk assessment work on food safety.

The main objective of the Survey was to obtain food consumption information, especially, the types and the amount of food consumed by the Hong Kong population. In addition, some basic anthropometric and demographic information of the respondents enumerated in the Survey were also obtained for facilitating the interpretation of the food consumption information collected.

For each respondent, two 24-hour dietary recall (24HDR) interviews were conducted on two non-consecutive days by asking each respondent to recall all foods and beverages consumed in the previous 24 hours. Such data were entered into the HKDiet System running on laptop computers operated by the interviewers using the multiple pass interviewing process. In addition, food consumption information of some selected food items was also collected under the "Food frequency questionnaire" (FFQ).

A two-stage sampling design was adopted in the Survey. A representative sample list containing replicates of quarters was drawn from the database "Frame of Quarters" maintained by the Census and Statistics Department (C\&SD). One target respondent from each household of the living quarters was randomly selected for the interview through the Kish grid method. In order to estimate and analyse the food consumption pattern of the population, a statistical grossing up process was adopted before analysing the data.

The potential target respondents of this Survey were the land-based non-institutional population of Hong Kong aged 18 or above who speak Cantonese, Mandarin or English. Foreign domestic helpers and visitors were excluded from the Survey. A total of 3752 respondents completed the Survey, representing 53.4\% of eligible respondents sampled in the Survey.

## Food Consumption Information

Based on the information collected from the 24HDR interviews, the Survey has obtained an updated set of food consumption data comprising the average daily intake amounts of 30 food groups and 160 food subgroups consumed by the Hong Kong population. Hong Kong adults, on average, consumed a total of 1.15 kg of solid food and 1741 ml of liquid food (including water) per day. Based on the average daily food intake amount consumed by the population, the findings on some major food groups are presented as follows.

Cereals and grains products were consumed in the amount of $395.31 \mathrm{~g} / \mathrm{day}, 61.2 \%$ ( 242.12 $\mathrm{g} /$ day) of which was from the rice subgroup. Pasta/noodle from all origins (including rice, wheat, etc.) made up another $36.4 \%$ ( $143.72 \mathrm{~g} /$ day ) of the cereals and grains products group.

Bakery wares and Chinese pastry is a food group closely related to cereals and grains products because the foods in the former food group contain a significant proportion of cereals and grains ingredients. Bakery wares and Chinese pastry were consumed in the amount of $45.56 \mathrm{~g} /$ day, around $70 \%$ of which was from bread/roll ( $31.51 \mathrm{~g} /$ day).

Vegetables and fruits were consumed in the amount of $202.65 \mathrm{~g} /$ day and $120.31 \mathrm{~g} /$ day respectively. Leafy vegetables and brassica vegetables contributed over half $(112.04 \mathrm{~g})$ of the daily vegetables consumption. Another $16.8 \%$ was from fruiting vegetables and squashes/gourds ( 34.05 g ). Slightly less than $10 \%(19.83 \mathrm{~g})$ was from root vegetables/tubers. Citrus fruits contributed to around one-third ( $41.10 \mathrm{~g} /$ day or $34.2 \%$ ) of the daily fruit consumption. Another $26.0 \%$ was from pome fruits ( $31.29 \mathrm{~g} /$ day ).

Meat and poultry were consumed in the amount of $78.36 \mathrm{~g} /$ day and $32.12 \mathrm{~g} /$ day respectively. For the meat group, around $70 \%$ of the amount consumed was from pig other than offal ( 54.77 $\mathrm{g} /$ day ). Another $24 \%$ was from cattle/calf other than offal ( $18.63 \mathrm{~g} /$ day $)$. As for the poultry group, over $95 \%$ of the amount consumed was from chicken other than offal ( $30.63 \mathrm{~g} /$ day ). Fish was consumed in the amount of $43.54 \mathrm{~g} /$ day.

The consumption of egg and egg products was $26.44 \mathrm{~g} /$ day, more than $95 \%$ of which was from chicken eggs. Milk and dairy products were consumed in the amount of $24.86 \mathrm{~g} / \mathrm{day}$, of which over three-quarters ( 19.56 g or $78.7 \%$ ) was from milk, milk beverage and dried milk.

Regarding local favourites, dim sum (a large range of small Chinese dishes that contain various ingredients or fillings) was consumed in the amount of $48.05 \mathrm{~g} /$ day, whereas siu-mei and lomei (a group of mainly meat and poultry products which have been barbequed, roasted or marinated) was consumed at $15.34 \mathrm{~g} /$ day. The detailed average daily intake amounts of the 30 food groups and 160 food subgroups are presented in Table A. 1 and Table A. 2 respectively.

Through the use of FFQ, the Survey has also obtained food consumption data of some selected seasonal foods (e.g. longans and lychees) and festive foods (e.g. Chinese New Year pudding and baked mooncake) which might be less likely to be captured from the 24HDR interviews, as well as some other foods which were of special interest for food safety/risk assessment (e.g. raw oysters and swordfish sashimi). The amounts of food intake per day of these 36 selected food items over the past 12 months prior to the interview are presented in Table A.5.

### 1.1 Background

1.1.1 The Food and Environmental Hygiene Department (FEHD) adopts a food safety control paradigm based on the risk analysis model. In line with the best international practices and recommendations of the Food and Agricultural Organization (FAO) and the World Health Organization (WHO), the risk analysis model provides the basis for effective utilisation of resources and priority setting.
1.1.2 The risk analysis model is well-defined to be based on the intertwining processes of risk assessment, risk management, and risk communication. One well-defined characteristic of risk assessment is the incorporation of a quantitative evaluation of the population's exposure to hazards via consumption of food. In other words, quantitative evaluation of risks has to be conducted with the availability of information on food consumption.
1.1.3 The overall dietary pattern of the population may change over time, as the composition of the population, in terms of say sex and age, changes over time. Furthermore, the dietary habits of consumers in individual sex and age subgroups may also change. Hence, food consumption data of the population have to be collected from time to time. In addition, to enhance FEHD's capacity in risk assessment, a scientific evaluation of known or potential adverse health effects resulting from human exposure to food borne hazards has to be estimated from the food consumption data. The first population-based food consumption survey ( 1 stFCS) was conducted in 2005-07. The present Survey is the second one launched by FEHD to obtain the most up-to-date food consumption information among the Hong Kong population. Policy 21 Limited (Policy 21) was commissioned by FEHD to conduct the Survey. Apart from updating the dietary patterns since the 1stFCS, additional information on new aspects relating to food consumption, such as cooking method, was also collected in the present Survey.
1.1.4 Policy 21 was commissioned by FEHD to conduct the Survey, and was responsible for the following tasks:
(a) Training and deploying of interviewers to collect data from respondents using the Hong Kong Diet (HKDiet) System developed by FEHD;
(b) Developing the Fieldwork Management Computer Module to monitor the fieldwork progress;
(c) Carrying out data quality control;
(d) Preparing clean datasets and statistical tabulation; and
(e) Analysing the data collected and compiling the survey report.

### 1.2 Survey objective

1.2.1 The main objective of the Survey was to obtain food consumption information, especially, the types and the amount of food consumed by the Hong Kong population. In addition, some basic anthropometric and demographic information of the respondents enumerated in the Survey were also obtained for facilitating the interpretation of the food consumption information collected.

### 1.3 Data collection period

1.3.1 The main data collection was scheduled to be conducted throughout the four quarters of the year in order to collect representative dietary intake data and capture seasonal variation in food intake in the population.

### 1.4 Survey respondents

1.4.1 The potential target respondents of this Survey were the land-based non-institutional population of Hong Kong aged 18 or above who speak Cantonese, Mandarin or English. Foreign domestic helpers and visitors were excluded from the Survey. A total of 3752 respondents had been successfully enumerated in the fieldwork period.

### 1.5 Sampling method

1.5.1 A representative sample list containing replicates of quarters was drawn from the database "Frame of Quarters" maintained by Census and Statistics Department (C\&SD). The Frame of Quarters was composed of two different types of quarters, namely the Register of Quarters (RQ) and the Register of Segments (RS).
1.5.2 Records of quarters in the RQ were firstly sorted by geographical areas (i.e. Constituency Areas) and quarters types. After the sorting, systematic replicated sampling was applied to the sample selection of quarters from the RQ. Sampling units were drawn with a fixed interval after selecting a random start to form sample replicates. The sampling method for the RS was similar to the sampling method for $R Q$, except that the area of segments was sorted by geographical areas (i.e. Constituency Areas) only.
1.5.3 All households in a selected living quarters were subject to sample selection. One target respondent from each household in the selected living quarters was randomly selected for the interview through the Kish grid method. Under such method, each living quarters was assigned a Kish grid table code, from A to F, during the sampling process. When a household with eligible members was identified, these eligible members were ordered by sex by age, with the eldest first. Then, the appropriate member was selected based on the Kish grid table code for the households and the number of eligible members for the Survey. (For living quarters with more than one households, all the households would adopt the same Kish grid table.) The relevant Kish grid table is given in Table 1.1.

Table 1.1 Kish Grid

| Proportion on the <br> assigned table | Table code | If the number of eligible household members is: |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 |  | 2 | 3 | 4 | 5 | 6 or more |
|  |  | Select respondent numbered |  |  |  |  |  |  |
| $1 / 6$ |  | 1 | 1 | 1 | 1 | 1 | 1 |  |
| $1 / 12$ |  | 1 | 1 | 1 | 1 | 2 | 2 |  |
| $1 / 12$ |  | 1 | 1 | 1 | 2 | 2 | 2 |  |
| $1 / 6$ |  | 1 | 1 | 2 | 2 | 3 | 3 |  |
| $1 / 6$ |  | 1 | 2 | 2 | 3 | 4 | 4 |  |
| $1 / 12$ | E1 | 1 | 2 | 3 | 3 | 3 | 5 |  |
| $1 / 12$ | E2 | 1 | 2 | 3 | 4 | 5 | 5 |  |
| $1 / 6$ | F | 1 | 2 | 3 | 4 | 5 | 6 |  |

### 1.6 Estimation method

1.6.1 A two-stage sampling design was adopted in the Survey, in which households within living quarters were selected from the "Frame of Quarters" maintained by the C\&SD and one respondent was selected from the household according to the Kish grid table. In order to estimate and analyse the pattern of the population, instead of the sample count, a statistical grossing up process was carried out and a grossing up factor/weighting was compiled and assigned to individual data.
1.6.2 Basically the grossing up factor was the inverse of the probability of selection. Given that this was a two-stage sampling design, the probabilities of selection in both stages had been considered. Furthermore, the responding pattern of individual respondents might not be uniform across different sex and age groups. In order to present a complete picture for the target population, the statistical grossing up process included a benchmark process by making reference to the distribution of population by sex and age as found in the General Household Survey (GHS) of the C\&SD of the relevant period. The uneven non-response pattern was then handled during the benchmark weighting process.
1.6.3 This report covers data collected from April 2018 to February 2020. The middle period was around the beginning of 2019. Hence, the GHS population distribution as at 1st quarter 2019 was used as the benchmark.
1.6.4 Unless otherwise stated, statistics presented in this report refer to the grossing up or weighted respondents and consumers.
1.6.5 As this report covers a random sample of 3752 completed cases, the findings are subject to sampling variation. Furthermore, as the pattern of responding is not uniform across different age-sex subgroups, caution should be taken in interpreting these findings.

### 1.7 Data collection method and research instruments

1.7.1 In the Survey, two major computer programs installed in the notebook computers
were used to collect information from the target respondents, namely (a) the HKDiet System; and (b) the Fieldwork Management Computer Module.

## Fieldwork Management Computer Module

1.7.2 A special computer program, the Fieldwork Management Computer Module, has been developed for the purpose of facilitating fieldwork management. It was installed in every notebook computer designated for the fieldwork of this Survey and was able to link up with the data collected by the HKDiet System using the Living Quarters (LQ) codes which were based on the pre-designed respondent code for each sampled LQ.
1.7.3 During data collection, the interviewer would find out the total number of households during the first visit and enter this piece of information into the Fieldwork Management Computer Module for generating the respondent codes (RCs) which corresponded to the number of households in a sampled LQ, so as to ensure the uniqueness of the respondent code.
1.7.4 The HKDiet System serial number was automatically generated by the system. To facilitate linkage between the HKDiet System and the Fieldwork Management Computer Module, the HKDiet System serial number was required to be inputted to the Fieldwork Management Computer Module.
1.7.5 To protect personal information collected from members of the sampled households by using the Fieldwork Management Computer Module, all personal data (i.e. name and phone number) stored and displayed in the Module were encoded.
1.7.6 The following information was recorded or collected through the Fieldwork Management Computer Module:

- Respondent call name (in form of codes);
- Contact phone number (in form of codes);
- Date and time of visits;
- Sex and age of all household members aged 18 or above (except foreign domestic helpers);
- Contact results: enumerated, partially enumerated, non-contact, vacant, demolished, unidentified address, no eligible household members because of language problem or all household members below 18 years old, and so forth;
- Interview day sequence (i.e. the first interview (Day-1) or the second interview (Day-2)); and
- Questionnaires completed (i.e. Day-1 24HDR, Day-2 24HDR and FFQ)
1.7.7 The HKDiet System is a computer program developed by FEHD with pre-installed supporting databases (including food coding database, recipe database, food composition database, portion size measurement database) to record dietary information, height and weight data, and demographic information in electronic means during fieldwork. The system was operated by well-trained interviewers.
1.7.8 The HKDiet system has built-in validation functions to enhance within record consistency and accuracy of the collected data. For example, any missing information and unusual intakes which might be due to errors in data input or reporting errors on the part of the respondents were highlighted by the system, such that further probing or checking with the respondents could be undertaken by the interviewers during the interview. In addition, specific details had been preinstalled in the HKDiet System for automatic computation of the consumption amounts of oils and seasonings with reference to the food preparation methods reported by the respondents. The system also comes with built-in guides and prompt messages to assist the interviewers in obtaining details of food intake throughout the interview process.
1.7.9 Upon identifying a need to include new food items and recipes as reported by the respondents during fieldwork, all supporting databases installed in the HKDiet System would be updated.
1.7.10 The HKDiet System also comes with export functions to enable the collected data to be exported in Microsoft Excel format for further data processing.

## Demographic information

1.7.11 Demographic information was the data related to the socio-demographic characteristics of respondents which included sex, age, number of years living in Hong Kong, ethnicity, educational level and occupation. All demographic information was collected in the first interview.

## Height and weight

1.7.12 Height and weight data were recorded in the format of centimetre and kilogram respectively. Both data items were collected in the first interview. The interviewers followed the standard procedures to measure the weight of the respondents (to the nearest one decimal place) twice by a portable electronic weighing scale in the first interview. Respondents were allowed to self-report their weight. For height, the respondents were asked to report their height. Measurement would only be taken by the interviewers with tape measure if the respondents failed to provide the required information.
1.7.13 To ensure the accuracy of the weight measurement data, the electronic weighing scale was calibrated once every two weeks. The body weight measurement procedure was also part of the food consumption interviewer training, in which the interviewers learned the correct use, including calibration, of the digital weight scale (Tanita HD-

## Dietary information

1.7.14 Dietary information refers to data collected from the "24-hour dietary recall" ( 24 HDR ) and the "Food frequency questionnaire" (FFQ) interviews. For 24HDR interviews, the multiple pass interview method was adopted. For each respondent, two 24HDR interviews were conducted on two non-consecutive days by asking each respondent to recall all foods and beverages consumed in the previous 24 hours starting at 06:00 in the morning of the day before the interview to 06:00 in the morning on the day of the interview. The interviewers would show the food portion measurement aids (such as food photo booklet, household utensils, etc.) to the respondents to help them estimate the food intake amount to be recorded in the HKDiet System by the interviewers. The Day-1 24HDR interview was required to be a face-to-face interview and the Day-2 24HDR interview could be either a face-to-face or a telephone interview. The two 24HDR interviews were separated by at least three days but subject to the availability of the respondents not more than eleven days apart. Furthermore, the two interviews should not fall on the same weekdays of the week, whereas no more than one interview could fall on weekend/public holiday.
1.7.15 Food and beverages consumed were grouped under 30 food groups. These were further subdivided into 167 food subgroups and 1871 food items at the start of the Survey. During the course of data collection, some food items which did not fall into or match with the predefined 1871 food items were identified. 17 new food items were then added so as to cater for these newly identified food, as pointed out in para. 1.7.9 above, making up a total of 1888 food items in the food item list. The number of food groups and food subgroups remained unchanged. An example of food group, food subgroup and food items is given in Table 1.2.

Table 1.2 Examples of food group, food subgroups and food items

| Food Group |  |  |
| :---: | :---: | :---: |
| Food Subgroup |  |  |
|  |  | Food Item |
| 2F06 Meat |  |  |
| 2F0601 | Cattle/Calf other than offal |  |
|  | 2F0601001 | Beef |
|  | 2F0601002 | Beef ball |
|  | 2F0601003 | Beef bologna |
|  | 2F0601004 | Beef flank |
|  | 2F0601005 | Beef pastrami |
|  | 2F0601006 | Beef salami |
|  | 2F0601007 | Beef sausage |
|  | 2F0601008 | Beef steak |
|  | 2F0601009 | Beef, dried/ Beef jerky |
|  | 2F0601010 | Beef, minced (ground) |
|  | 2F0601011 | Cattle bone marrow |
|  | 2F0601012 | Corned beef |
|  | 2F0601013 | Hamburger steak |
|  | 2F0601014 | Ox tail |
|  | 2F0601015 | Veal ribs |
|  | 2F0601999 | Cattle/Calf other than offal(item not specified) |
| 2F0602 | Cattle/Calf offal |  |
|  | 2F0602001 | Cattle blood |
|  | 2F0602002 | Cattle brain |
|  | ....... | ....... |
| 2F0603 | Pig other than offal |  |
| ....... | ....... |  |
| 2F0699 | Meat, not specified |  |

1.7.16 Intake of cooked food by consumers was from two channels, viz self-cooking or prepared by food premises. For the self-cooked food, the HKDiet System would guide the interviewer to collect information on the food and amount consumed, item by item. Information on cooking method was also collected.
1.7.17 As for the food prepared according to recipes, a recipe database covering over 1000 representative or 'standard' as well as less typical recipes was prepared prior to the
start of the Survey. Once an appropriate recipe was identified and the amount consumed inputted, the HKDiet System would generate the relevant food items/ingredients and their corresponding consumption amount. Slight modification of the composition of the recipe, such as swapping or excluding some ingredients, could be entertained during the interview. In the event that more complicated adjustment to the recipe was required, it would be dealt with during the subsequent data verification stage. However, as the aim of the Survey is to obtain consumption amounts of individual food ingredients, the consumption amount of recipes consumed was not retained in the dataset after calculations. An example of a recipe is given in Table 1.3.

Table 1.3 Example of recipe

| Sauteed beef (Chinese-style) | 2R0303E022 |
| :--- | :--- |
| Portion unit | Bowl (250ml) |
| Edible Amount per Portion Unit | 180 g |
| Cooking method | Stewed/braised |
|  | Proportion (\%) |
| Ingredients | 49.081 |
| Beef | 24.541 |
| Onion | 10.634 |
| Water (for recipe use) | 2.945 |
| Chicken egg yolk | 2.618 |
| Tomato paste or Catsup/Ketchup | 2.413 |
| Fats and oils (item not specified) | 1.963 |
| Brown sugar | 1.609 |
| Soya sauce | 1.145 |
| Cornstarch | 0.872 |
| Condiments/Savoury Sauces (item not specified) | 0.804 |
| Worcestershire sauce | 0.654 |
| Chicken powder/cube | 0.327 |
| Granulated sugar | 0.327 |
| Sesame seed oil | 0.065 |
| Food colouring |  |

1.7.18 In addition to 24 HDR , each respondent was required to complete the FFQ in the first interview. However, if there was an acceptable reason, such as insufficient time, the FFQ could be completed in the second interview. This questionnaire consisted of a series of pre-structured semi-quantitative food frequency questions for 25 selected foods of special interest for food safety/risk assessment and 11 seasonal/festive food consumed over the past 12 months prior to the interview. The list of seasonal/festive foods with the duration of season/festive period is given in Table 1.4.

Table 1.4 Duration of season/festive period for seasonal/festive foods

| FFQ item no. | FFQ item name | Duration of <br> peak <br> consumption <br> period (days) | Whether <br> available all <br> year round/ <br> only in season |
| :--- | :--- | :---: | :--- |
| 2FFQ026 | Chinese New Year pudding | 30 | only in season |
| 2FFQ027 | Chinese New Year sweetened fruit <br> and vegetables | 30 | only in season |
| 2FFQ028 | Crispy triangle | 30 | only in season |
| 2FFQ029 | Sesame ball | 30 | all year round |
| 2FFQ030 | Melon seeds | 30 | all year round |
| 2FFQ031 | Glutinous rice dumplings | 30 | all year round |
| 2FFQ032 | Longans | 90 | all year round\# |
| 2FFQ033 | Lychees | 90 | all year round\# |
| 2FFQ034 | Baked mooncake | 45 | only in season |
| 2FFQ035 | Snowy mooncake | 45 | only in season |
| 2FFQ036 | Freshwater hairy crab/mitten crab | 150 | only in season |

\# including processed forms, such as canned products

### 1.8 Training of interviewers and pilot testing

1.8.1 Survey interviewers were given 5 days' training (including comprehensive fieldwork training by the Fieldwork Manager and training on the techniques for collecting dietary information and taking height and weight measurements by the Research Manager (Nutrition)) and were assessed at the end of the training period. Only interviewers who had passed the assessment were deployed to carry out data collection. In order to field test the research instruments and methodologies for the survey, a pilot test was conducted. Taking into account the experience gained from the pilot test, the research instruments had been amended and the fieldwork arrangements had been fine-tuned.

### 2.1 Fieldwork statistics

2.1.1 All households in the sampled $L Q$ had been visited during the fieldwork period from April 2018 to February 2020. A total of 3752 respondents were successfully enumerated in the fieldwork period, and the response rate was $53.4 \%$.
2.1.2 The distribution of completed cases over the four quarters of the Survey is presented in Table 2.1.

Table 2.1 Distribution of respondents by sex and age group in the four Survey quarters

|  | Quarter 1 <br> $(2019 \&$ <br> $2020)$ | Quarter 2 <br> $(2018 ~ \& ~$ <br> $2019)$ |  | Quarter 3 <br> $(2018 ~ \& ~$ <br> $2019)$ |  | Quarter 4 <br> $(2018 \&$ <br> $2019)$ | Total |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group | M | F | M | F | M | F | M | F | M | F |
| $18-29$ | 66 | 58 | 69 | 53 | 53 | 35 | 50 | 40 | 238 | 186 |
| $30-49$ | 124 | 171 | 164 | 215 | 106 | 168 | 73 | 141 | 467 | 695 |
| $50-64$ | 105 | 143 | 177 | 199 | 86 | 146 | 115 | 145 | 483 | 633 |
| $65+$ | 97 | 155 | 130 | 179 | 113 | 132 | 116 | 128 | 456 | 594 |
| Sub-total | 392 | 527 | 540 | 646 | 358 | 481 | 354 | 454 | 1644 | 2108 |
| Quarter | 919 | 1186 | 839 | 808 | 3752 |  |  |  |  |  |
| Total (\%) | $(24.49 \%)$ | $(31.61 \%)$ | $(22.36 \%)$ | $(21.54 \%)$ | $(100.00 \%)$ |  |  |  |  |  |

2.1.3 Among the two non-consecutive days of 24 HDR interviews, around $86.5 \%$ were conducted on weekdays and $13.5 \%$ were on weekends, and $92.3 \%$ of these two 24 HDR interviews were conducted within 3 to 11 days (inclusive). Regarding the interview duration, the mode duration for the Day-1 24HDR, which was conducted by face-to-face interview, was 21 minutes. The mode duration for the Day-2 24 HDR , which was mostly conducted via telephone interview, was 14 minutes. As for the FFQ, the mode duration was 10 minutes. It should be noted that the time spent on explaining the Survey objectives and the operational arrangement to the householders, the identification of the respondents with Kish grid selection and the collection of demographic, height and weight data from the respondents was not included in the interview duration mentioned above.

### 2.2 Data editing and quality control

2.2.1 The data verification and editing were performed by the supervisors when the data were synchronized with the central database on the computer server. During the synchronization process, the supervisors verified the record and the whole interviewing process with the corresponding interviewers such as the correctness of the sampling procedures and the proper record of food consumption information provided by the respondents. In case of unusual or doubtful situations, the respondents were contacted for follow-up verification by phone call when necessary.
2.2.2 The quality of the dietary data was also monitored by a nutrition team consisting of dietitians and nutritionists. In case of difficulties in matching the foods reported by the respondents with the appropriate food code in the HKDiet System, the interviewers would enter some remarks in the System, based on information provided by the respondents, and the nutrition team would subsequently provide support in coding these food items. Moreover, when food coding was found not accurately reflecting the food consumption information reported, the food item was recoded by the nutrition team.
2.2.3 Apart from the data editing and verification processes, a random sample of the completed cases was checked by an independent team of quality checkers. It was conducted by contacting the respondents for verifying the data provided.
2.2.4 The above mentioned quality control measures were continuously put in place during the entire data collection period to monitor the performance of the interviewers. Only interviewers with satisfactory performance could work in the field to collect data.
2.2.5 To minimise the occurrence of missing values in the dataset, the HKDiet System has built-in validation functions to provide pop-up reminders and highlight the missing data for further probing and checking with the respondents. The interviewers were trained with adequate interviewing techniques to minimise missing information as reasonably practicable. For the demographic information, the interviewers were trained to reassure the confidentiality of all information collected to minimise the risk of intentionally mis-reporting their demographic information by the respondents. During the interview of FFQ, the HKDiet System would remind the interviewers the food items with missing values and the fields that had to be filled with valid data before the interview could continue. In case the respondents reported "don't know/not sure", the interviewers were trained to use the Food Photo Booklet, probes and prompts skillfully to facilitate the recall process.
2.2.6 For each food item in both 24 HDR and FFQ, the distribution of the consumption amount was examined. Unusually large amounts were identified and the original interview records were checked with the interviewers and respondents, if possible, to examine whether the large amount was a result of a large consumption reported by the respondent or data entry error made by the interviewer.
2.2.7 It was noted that some food intake values would likely represent unusual food intake patterns without error. These unusual value cases will be important in risk assessment work and may be important in the identification of any high-risk groups. Hence, all these cases had been reviewed case by case, in which decisions were made
with extreme caution as to whether these values were plausible, and only those values that were clearly impossible were imputed.

### 3.1 Sex and age

3.1.1 Among the 3752 respondents completing the survey, 1644 (43.8\%) of them were male and $2108(56.2 \%)$ of them were female. The breakdown of these respondents by age and sex is given in Table 3.1 below.

Table 3.1 Number of respondents by sex and age (sample count)

|  | Male |  | Female |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age | Number | $\%$ | Number | $\%$ | Number | $\%$ |
| $18-29$ | 238 | 14.5 | 186 | 8.8 | 424 | 11.3 |
| $30-49$ | 467 | 28.4 | 695 | 33.0 | 1162 | 31.0 |
| $50-64$ | 483 | 29.4 | 633 | 30.0 | 1116 | 29.7 |
| $65+$ | 456 | 27.7 | 594 | 28.2 | 1050 | 28.0 |
| Total | 1644 | 100.0 | 2108 | 100.0 | 3752 | 100.0 |

Note
(1) Percentages may not add up to total due to rounding.
3.1.2 Based on the statistics from the GHS of C\&SD, the weighted distribution of respondents by sex and age as at $1^{\text {st }}$ quarter 2019 was compiled and is given in Table 3.2.

Table 3.2 Weighted number of respondents by sex and age

| Male |  |  |  |  |  |  |  | Female |  | Total |  |
| :---: | :---: | :---: | ---: | :---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age | Number | $\%$ | Number | $\%$ | Number | $\%$ |  |  |  |  |  |
| $18-29$ | 494000 | 17.3 | 492200 | 15.3 | 986300 | 16.3 |  |  |  |  |  |
| $30-49$ | 928800 | 32.6 | 1129900 | 35.2 | 2058700 | 34.0 |  |  |  |  |  |
| $50-64$ | 841800 | 29.5 | 927000 | 28.9 | 1768800 | 29.2 |  |  |  |  |  |
| $65+$ | 588600 | 20.6 | 660400 | 20.6 | 1249000 | 20.6 |  |  |  |  |  |
| Total | 2853200 | 100.0 | 3209600 | 100.0 | 6062800 | 100.0 |  |  |  |  |  |

Notes
(1) Numbers are rounded to the nearest hundred.
(2) Numbers and percentages may not add up to total due to rounding.
3.1.3 Around $50 \%$ of the (weighted) respondents was aged 50 or over. As for the 1 stFCS conducted in 2005-2007, only $36 \%$ of the weighted respondents fell into such age group. It should be borne in mind that such difference in the age composition might affect the comparison of various statistics covering all respondents as compiled in
this Survey and the 1stFCS. (Direct comparison by individual age groups is not carried out as the two surveys adopted slightly different age grouping.)
3.1.4 The percentage shares for the younger population in the sample count (Table 3.1) are smaller than the weighted respondents (Table 3.2), for both male and female. Given such smaller shares, care should be taken when analysing the statistics of the age group 18-29, particularly for further breakdown within this age group by other characteristics. It may be required to combine the findings for the age groups 1829 and 30-49 for some statistics. For example, if analysis by sex and age is required, the findings for the groups of female aged 18-29, or male aged 18-29 alone would be subjected to large estimation error. It is advisable to combine the findings to the groups of female aged 18-49, or male aged 18-49. Another way is to look at the age group 18-29 only (i.e. without sex breakdown).

### 3.2 Height and weight

3.2.1 The overall average height of (weighted) respondents was 169.97 cm and 157.61 cm for male and female respectively. (Table 3.3)

Table 3.3 Average height of (weighted) respondents by sex and age (cm)

| Age | Male |  |  | Female |  |  | Total |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Mean | SD | Number | Mean | SD | Number | Mean | SD |
| 18-29 | 494000 | 172.98 | 6.09 | 492200 | 159.77 | 5.78 | 986300 | 166.39 | 8.88 |
| 30-49 | 928800 | 172.38 | 6.44 | 1127000 | 159.10 | 5.69 | 2055700 | 165.10 | 8.96 |
| 50-64 | 839500 | 168.54 | 6.35 | 920900 | 157.14 | 5.35 | 1760400 | 162.58 | 8.16 |
| 65+ | 582200 | 165.65 | 6.27 | 656900 | 154.11 | 6.26 | 1239100 | 159.54 | 8.51 |
| Total | 2844500 | 169.97 | 6.91 | 3197100 | 157.61 | 6.08 | 6041500 | 163.43 | 8.95 |
| Refusal | 8700 | - | - | 12500 | - | - | 21200 | - | - |

(1) $95.9 \%$ of the height data were self-reported by respondents
(2) Numbers are rounded to the nearest hundred.
(3) Numbers may not add up to total due to rounding.
(4) SD denotes Standard Deviation.
3.2.2 The average weight of respondents by sex and age is given in Table 3.4. For the male respondents, the average weight was 69.58 kg . As for the female, the average weight was 57.12 kg . (Table 3.4)

Table 3.4 Average weight of (weighted) respondents by sex and age (kg)

| Age | Male |  |  | Female |  |  | Total |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Mean | SD | Number | Mean | SD | Number | Mean | SD |
| 18-29 | 494000 | 67.42 | 12.32 | 484900 | 55.27 | 10.23 | 979000 | 61.40 | 12.86 |
| 30-49 | 925900 | 73.16 | 12.87 | 1125400 | 56.95 | 9.56 | 2051400 | 64.27 | 13.78 |
| 50-64 | 839500 | 70.17 | 11.64 | 921800 | 58.66 | 9.31 | 1761300 | 64.15 | 11.96 |
| 65+ | 581500 | 64.88 | 10.46 | 651200 | 56.61 | 10.10 | 1232800 | 60.51 | 11.07 |
| Total | 2841000 | 69.58 | 12.35 | 3183400 | 57.12 | 9.77 | 6024400 | 63.00 | 12.69 |
| Refusal | 12200 | - | - | 26200 | - | - | 38300 | - | - |

Notes
(1) $20.5 \%$ of the weight data were self-reported by respondents
(2) Numbers are rounded to the nearest hundred.
(3) Numbers may not add up to total due to rounding.
(4) SD denotes Standard Deviation.

### 3.3 BMI (Body Mass Index)

3.3.1 The average BMI by sex and age is given in Table 3.5.

Table 3.5 Average calculated BMI of (weighted) respondents by sex and age

| Age | Male |  |  | Female |  |  | Total |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Mean | SD | Number | Mean | SD | Number | Mean | SD |
| 18-29 | 494000 | 22.51 | 3.79 | 484900 | 21.63 | 3.66 | 979000 | 22.07 | 3.75 |
| 30-49 | 925900 | 24.62 | 4.10 | 1124000 | 22.51 | 3.65 | 2050000 | 23.46 | 4.00 |
| 50-64 | 839500 | 24.67 | 3.63 | 918000 | 23.78 | 3.80 | 1757500 | 24.21 | 3.75 |
| 65+ | 580200 | 23.65 | 3.67 | 649500 | 23.83 | 3.94 | 1229700 | 23.75 | 3.82 |
| Total | 2839700 | 24.07 | 3.91 | 3176500 | 23.01 | 3.85 | 6016200 | 23.51 | 3.91 |
| Missing\# | 13500 | - | - | 33100 | - | - | 46600 | - | - |

Notes
(1) $\mathrm{BMI}\left(\mathrm{kg} / \mathrm{m}^{2}\right)=$ weight $(\mathrm{kg}) /$ height $^{2}(\mathrm{~m})$
(2) Numbers are rounded to the nearest hundred.
(3) Numbers may not add up to total due to rounding.
(4) SD denotes Standard Deviation.
\# BMI cannot be computed for those respondents refused to provide information on height or weight.
3.3.2 The overall average BMI for the male and female respondents was 24.07 and 23.01 respectively. This was higher than the corresponding overall average in the 1 stFCS (with the overall average BMI of male and female being 23.7 and 22.7 respectively).
3.3.3 According to the recommendation of WHO, the Individual BMI for Asian adults can be classified into 4 groups, viz. underweight (under 18.5), normal (from 18.5 to less
than 23), overweight (from 23 to less than 25) and obese ( 25 and over). Table 3.6 shows the distribution of the respondents in these 4 groups by sex and age.

Table 3.6 Number and percentage distribution of (weighted) respondents by BMI group by sex and age

| BMI Group | Age |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 18-29 | 30-49 | 50-64 | $65+$ | Total |

|  | \% | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |

[^0](1) Numbers are rounded to the nearest hundred.
(2) Numbers and percentages may not add up to total due to rounding.

### 4.1 Food consumption

4.1.1 Around $85 \%$ of the respondents indicated that the reported food intakes in the 24HDR of the interview days were similar to their usual intakes, and the proportions of respondents claiming to have eaten less than usual or eaten more than usual were rather similar. The most common reasons given for eating more on the interview days were at a social function, special meal, or on a special day, while the most common reasons for eating less were not hungry and too busy. Over $90 \%$ of the respondents reported that they were not under a special diet, $3.8 \%$ reported that they were under a dietary management regime (such as for weight control), and $0.5 \%$ reported they were vegetarians.
4.1.2 Food items are grouped under 30 food groups. They are then classified into 167 food subgroups and 1871 food items. During the Survey, 17 additional food items were included, making up a total of 1888 food items in the food item list. Among them, food classified under all the 30 food groups, 160 food subgroups and 1539 food items were consumed by the respondents. Unless otherwise specified, the consumption amounts presented in this section represent the average daily food intake of all respondents collected from Day-1 and Day-2 24HDR interviews after weighting.
4.1.3 The average total daily solid food consumption and liquid food intake were 1.15 kg and 1741 ml respectively. There were variations by sex and age (Tables 4.1 and 4.2).

Table 4.1 Average solid food consumed per day of (weighted) respondents by sex and age (g)

|  | Age |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Sex | $18-29$ | $30-49$ | $50-64$ | $65+$ | Total |
| Male | 1195.5 | 1299.9 | 1273.3 | 1153.5 | 1243.8 |
| Female | 983.0 | 1075.0 | 1103.6 | 1041.3 | 1062.2 |
| Total | 1089.5 | 1176.5 | 1184.3 | 1094.2 | 1147.7 |

Table 4.2 Average fluid consumed per day of (weighted) respondents by sex and age (ml)

|  | Age |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Sex | $18-29$ | $30-49$ | $50-64$ | $65+$ | Total |
| Male | 1939.2 | 1953.5 | 1860.2 | 1570.9 | 1844.6 |
| Female | 1668.1 | 1767.7 | 1668.7 | 1401.9 | 1648.5 |
| Total | 1803.9 | 1851.5 | 1759.8 | 1481.5 | 1740.8 |

### 4.2 Food consumption by food group

4.2.1 Cereals and grains products were consumed in the amount of $395.31 \mathrm{~g} /$ day, $61.2 \%$ ( $242.12 \mathrm{~g} /$ day) of which was from the rice subgroup. Pasta/noodle from all origins (including rice, wheat, etc.) made up another $36.4 \%$ ( $143.72 \mathrm{~g} /$ day) of the cereals and grains products group. Bakery wares and Chinese pastry is a food group closely related to cereals and grains products because the foods in the former food group contain a significant proportion of cereals and grains ingredients. Bakery wares and Chinese pastry were consumed in the amount of $45.56 \mathrm{~g} / \mathrm{day}$, around $70 \%$ of which was from bread/roll ( $31.51 \mathrm{~g} /$ day $)$.
4.2.2 Vegetables and fruits were consumed in the amount of $202.65 \mathrm{~g} /$ day and $120.31 \mathrm{~g} /$ day respectively. Leafy vegetables and brassica vegetables contributed to more than half ( $112.04 \mathrm{~g} /$ day or $55.3 \%$ ) of the daily vegetables consumption. Another $16.8 \%$ was from fruiting vegetables and squashes/gourds ( $34.05 \mathrm{~g} / \mathrm{day}$ ). Slightly less than $10 \%$ ( $19.83 \mathrm{~g} /$ day) was from root vegetables/tubers. Only $6.5 \%$ ( $13.21 \mathrm{~g} /$ day) was from legume vegetables, pulses and their products. Citrus fruits contributed to around one-third ( $41.10 \mathrm{~g} /$ day or $34.2 \%$ ) of the daily fruit consumption. Another $26.0 \%$ was from pome fruits ( $31.29 \mathrm{~g} /$ day).
4.2.3 The daily consumption of meat, poultry and game was 110.54 g in total, whereas the intake from the meat group and poultry group were $78.36 \mathrm{~g} /$ day and $32.12 \mathrm{~g} /$ day respectively. For the meat group, around $70 \%$ of the amount consumed was from pig other than offal ( $54.77 \mathrm{~g} /$ day $)$. Another $24 \%$ was from cattle/calf other than offal ( $18.63 \mathrm{~g} /$ day $)$. As for the poultry group, chicken other than offal was consumed in the amount of $30.63 \mathrm{~g} /$ day (over $95 \%$ ). It should be noted that siu-mei and lo-mei were other sources of consumption of meat and poultry. If these sources were included, the daily meat and poultry consumption would be $85.06 \mathrm{~g} /$ day and $40.49 \mathrm{~g} /$ day respectively.
4.2.4 Fish and other aquatic animals (i.e. crustaceans and molluscs) consumption was found to be $55.59 \mathrm{~g} /$ day in total. The average daily fish consumption was 43.54 g , while the daily average for crustaceans (such as shrimp/prawn and crab) and molluscs (such as oyster and cuttlefish) were 6.28 g and 5.77 g respectively.
4.2.5 The consumption of egg and egg products was $26.44 \mathrm{~g} /$ day, more than $95 \%$ of which was from chicken eggs ( $25.52 \mathrm{~g} /$ day). Milk and dairy products were consumed in the amount of $24.86 \mathrm{~g} /$ day, of which over three-quarters ( $19.56 \mathrm{~g} /$ day or $78.7 \%$ ) was from milk, milk beverage and dried milk.
4.2.6 Regarding local favourites, dim sum (a large range of small Chinese dishes that contain various ingredients or fillings) was consumed in the amount $48.05 \mathrm{~g} /$ day, whereas siu-mei and lo-mei (a group of mainly meat and poultry products which have been barbequed, roasted or marinated) was consumed at $15.34 \mathrm{~g} / \mathrm{day}$. Additionally, the average daily consumption amounts for the sashimi and sushi group ( $5.57 \mathrm{~g} / \mathrm{day}$ ) and the burgers group ( $4.79 \mathrm{~g} /$ day ) were only around one-tenth of the consumption of the dim sum group. The daily consumption of pizza was even less ( $2.08 \mathrm{~g} / \mathrm{day}$ ).
4.2.7 With regard to fluid consumption, non-alcoholic beverages were consumed in a total volume of $1609.97 \mathrm{ml} /$ day. Among all fluids, water ( $1179.38 \mathrm{ml} /$ day), tea drink ( $273.13 \mathrm{ml} /$ day), and soups ( $143.62 \mathrm{ml} /$ day ) made up by far the bulk of the total fluid
consumption. These were followed by coffee/coffee substitute ( $47.84 \mathrm{ml} /$ day $)$, carbonated drink ( $33.58 \mathrm{ml} /$ day), soy, cereal, grain, seed and chocolate drink ( $24.85 \mathrm{ml} /$ day) , and fruit and vegetable juice drink ( $18.77 \mathrm{ml} /$ day). As for alcoholic beverages, 25.26 ml were consumed per day, of which three quarters $(18.97 \mathrm{ml}$ or $75.1 \%$ ) was from beer/ales.
4.2.8 The Survey also collected consumption amount of fats and oils ( $13.36 \mathrm{~g} /$ day $)$, sugars and confectionery ( $4.34 \mathrm{~g} /$ day), desserts ( $7.96 \mathrm{~g} /$ day) as well as salts, soya sauce, condiments and sauces ( $16.68 \mathrm{~g} /$ day ). However, given that these food items sometime appear as minor ingredients in other food items, such as fats and oils in sausages and spring rolls, sugar in tea and coffee, it is understood that their total consumption amounts were not exhaustively accounted for.
4.2.9 Tables A. 1 and A. 2 in the Annex present the distribution of food intake per day by respondents for individual food groups and food subgroups respectively. Readers should be cautioned that all the consumption amounts reported in this Chapter and the relevant tables are for individual food items consumed with corresponding consumption data available in the database. However, some food items are made up of multiple ingredients, but their consumption amounts were only captured in the form of "mixed food" items instead of being broken down into their ingredients. Some examples are milk tea, dim sum and burger. As a result, the milk in milk tea, fats and oils in dim sum and burger, were not included in the respective consumption amount figures for milk, fats and oils. This means that the results inevitably underestimate the actual consumption amount stated for the relevant food groups and food subgroups.

### 4.3 Comparison of food consumption in different sex and age groups

4.3.1 Tables A. 3 and A. 4 in Annex present the comparison of food consumption by food group in different sex and age groups respectively. Some of the key differences observed are highlighted in the following paragraphs.
4.3.2 For Cereals and grains products, male respondents consumed around $460 \mathrm{~g} /$ day, which was $36 \%$ more than their female counterparts, at around $338 \mathrm{~g} /$ day. Considering age, the average daily consumption was maintained at around $400 \mathrm{~g} /$ day for those aged below 65 . It then dropped slightly to around $368 \mathrm{~g} /$ day for those aged 65 or above.
4.3.3 The average daily consumption of vegetables was similar between male and female respondents (slightly over 200 g ), with lower consumption among the respondents aged 18-29 (around $180 \mathrm{~g} /$ day).
4.3.4 Both male and female consumers consumed around 150 g of fruit per day. However, only around $76 \%$ of the male respondents were consumers, whereas around $86 \%$ of the females were. Hence, on average more fruits were consumed by females than males, when considering all respondents. Looking at age variation, those aged 5064 and those aged 65 or above consumed more fruits than the two youngest age groups.
4.3.5 Around $92 \%$ of the male respondents consumed meat, as compared with $87 \%$ of the females. On average male consumers (around $104 \mathrm{~g} /$ day) also consumed more meat than female (around $72 \mathrm{~g} /$ day). Hence, the average daily consumption by all male respondents (around 96 g ) was greater than that for the female respondents (around 62 g ) by over $50 \%$. When analysed by age group, the oldest respondents (aged 65 or above) consumed the least (around $55 \mathrm{~g} /$ day). The daily consumption levels for the other age groups were around 80 g to 90 g .
4.3.6 Poultry was consumed more by the male respondents (around $35 \mathrm{~g} / \mathrm{day}$ ) than the female respondents (around $30 \mathrm{~g} /$ day). When analysed by age, respondents in the youngest age group (18-29) consumed the most (around $51 \mathrm{~g} /$ day). The amount dropped gradually with increasing age, down to only $15 \mathrm{~g} /$ day for those aged 65 or above.
4.3.7 Fish was consumed slightly more by the male respondents (around $45 \mathrm{~g} /$ day) than the female respondents (around $42 \mathrm{~g} /$ day). There was an increasing trend with age, both in terms of the percentage of respondents consuming fish and the average amount consumed by consumers. As a result, the daily consumption by all respondents increased from around 35 g for those aged 18-29 to around 55 g for those aged 65 or above.
4.3.8 Male respondents (around $32 \mathrm{~g} /$ day) consumed more egg and egg products than female respondents (around $22 \mathrm{~g} /$ day). When analysed by age group, those aged 65 or above consumed the least (around $19 \mathrm{~g} /$ day).
4.3.9 The daily consumption of milk and dairy products was nearly the same for male and female consumers (around 82 g ). However around one-third ( $34 \%$ ) of female respondents consumed this food, whereas only around one-quarter (26\%) of male respondents did so. Hence, the average daily consumption for all respondents was much greater for the female (around 28 g ) than the male respondents (around 21 g ). Consider age difference, those respondents aged 50-64 consumed the least (around $20 \mathrm{~g} /$ day). Respondents in the other three age groups consumed around $27 \mathrm{~g} /$ day.
4.3.10 For bakery wares and Chinese pastry, both male and female respondents consumed the same average amount, at around $45 \mathrm{~g} /$ day. However, only around $69 \%$ of the male respondents consumed this food, as compared to around $75 \%$ for the female respondents. On the other hand, the average daily consumption amount of the male consumers (around 67 g ) was higher than that of the female consumers (around 60 g ). Considering age variation, those respondents within the 30-49 and 50-64 age groups consumed around $48 \mathrm{~g} /$ day. Those in the other two groups (18-29 and 65 or above) only consumed around $41 \mathrm{~g} /$ day.
4.3.11 For non-alcoholic beverages, male respondents consumed (around $1700 \mathrm{ml} /$ day $)$ more than female respondents (around $1500 \mathrm{ml} /$ day), with the respondents aged 65 or above consumed the least (around $1400 \mathrm{ml} /$ day). For alcoholic beverages, male respondents (around $42 \mathrm{ml} /$ day) consumed much more than female respondents (around $10 \mathrm{ml} /$ day). Considering age, those respondents aged 50-64 consumed the most (around $34 \mathrm{ml} /$ day).
4.3.12 Among the 1514 female respondents aged 18-64 covered in this Report, 36 women were either pregnant or breast-feeding, accounting for around $2 \%$ of all female
respondents. Due to the small number of pregnant and lactating women in this survey, their food consumption pattern might not be representative of all pregnant or lactating women in Hong Kong and thus will not be presented in this report.

### 4.4 Changes in food consumption over time

4.4.1 A comparison of the daily food intake of selected food group/subgroup in this Survey and the 1stFCS is given in Table 4.3. However, as mentioned in Para 3.1.3, around $50 \%$ of the respondents in this Survey were aged 50 or above. As for the 1stFCS, only $36 \%$ were of such age. Given that both the amount and type of food intakes may be different among the younger and older persons, care should be taken in interpreting the comparison given in Table 4.3 and the following paragraphs. In addition, it is relevant to note that the grouping and classification of food items in the two surveys are not identical. For examples, some new food groups (including "Siu-mei and lo-mei", "Pizza", "Desserts" and "Bakery wares and Chinese pastry") have been created for this Survey by separating these new food groups from their respective original food groups in the 1stFCS (e.g. the new food group "Bakery wares and Chinese pastry" in this Survey was separated from the original food group "Cereals and grains products" in the 1stFCS). Thus the following comparison has to be interpreted with care.
4.4.2 The daily consumption of cereals and grains products decreased from 430.56 g to 395.31 g. The daily consumption of bakery ware and Chinese pastry also decreased from 58.19 g to 45.56 g .
4.4.3 The daily vegetables (including legumes) consumption increased from 191.08 g to 202.65 g during the period between the two surveys. On the other hand, fruits consumption dropped from 146.81 g to 120.31 g . Combining vegetables and fruits together, the total consumption was similar in these two surveys.
4.4.4 The daily meat consumption (including meats from Siu-mei and Lo-mei) increased from 74.23 g in the 1 stFCS to 85.06 g in this Survey. Poultry consumption (including those from Siu-mei and Lo-mei) also increased from 37.38 g to 40.49 g . Taking the daily consumption of meat and poultry together, it increased $12.5 \%$ (from 111.61 g to 125.55 g ) during the period between the two surveys. There was a considerable drop in the consumption of aquatic animals mainly from fish, from 57.48 g to 43.54 g .
4.4.5 The consumption of egg and egg products increased from 15.18 g to 26.44 g . There was a drop in the daily consumption of milk and dairy products, from 34.23 g to 24.86 g .
4.4.6 The daily non-alcoholic beverages consumption was maintained at around 1600 ml in the two surveys. Within this group, water consumption increased by around 110 ml (from 1065.62 ml to 1179.38 ml ). This was largely compensated by the drop in tea drink consumption (from 376.36 ml to 273.13 ml ). As for carbonated drink, the consumption also dropped from 41.02 ml to 33.58 ml . On the other hand, the coffee/coffee substitute consumption increased from 37.00 g to 47.84 g .

Table 4.3 Comparison of average daily food intake by (weighted) respondents in 1stFCS and 2ndFCS

|  | Food Group / Subgroup / Item | Unit | This Survey (2018-20) | $\begin{aligned} & \hline \text { 1st Survey } \\ & (2005-07) \\ & \hline \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| 2 F 01 | Cereals and Grains Products | g | 395.31 | 430.56 |

|  | Bread / Roll | g | 31.51 | 44.04 |

Table 4.3 (cont'd) Comparison of average daily food intake by (weighted) respondents in 1stFCS and 2ndFCS

|  | Food Group / Subgroup / Item | Unit | This Survey $(2018-20)$ | 1st Survey (2005-07) |
| :---: | :---: | :---: | :---: | :---: |
| 2F16 | Non-alcoholic Beverages | ml | 1609.97 | 1616.97 |
|  | Coffee / Coffee substitute | g | 47.84 | 37.00 |
|  | Tea drink | ml | 273.13 | 376.36 |
|  | Carbonated drink | ml | 33.58 | 41.02 |
|  | Water | ml | 1179.38 | 1065.62 |
| 2F17 | Alcoholic Beverages | ml | 25.26 | 33.04 |
|  | Beer / Ales | ml | 18.97 | 28.40 |
| 2F41 | Dim Sum | g | 48.05 | 44.75 |
| 2F42 | Sashimi and Sushi | g | 5.57 | 4.68 |
| 2F58 | Burgers | g | 4.79 | 4.74 |
| 2F43 | Siu-mei and Lo-mei | g | 15.34 | \#\#\#\# |
|  | Siu-mei and lo-mei meat items | g | 6.70 | \#\#\#\# |
|  | Siu-mei and lo-mei poultry items | g | 8.37 | \#\#\#\# |
|  | Siu-mei and lo-mei game items | g | 0.20 | \#\#\#\# |
| 2F59 | Desserts | g | 7.96 | 13.28 |

Notes:
(1) Given that the grouping and classification of food items in the 2 surveys are not identical, the above comparison have to be interpreted with care.
\# The daily intake of the respective food group included contribution from siu-mei and lo-mei items.
\#\# The daily intake of the respective food subgroup included contribution from offal items.
\#\#\# The daily intake of milk included milk from cow, buffalo and goat.
\#\#\#\# The daily intake of Sui-mei and Lo-mei has been included in the respective food groups.

### 4.5 Cooking method

4.5.1 Healthy eating is not just choosing the right foods, but also using healthy cooking methods. Some cooking methods affect the nutritional value or the level of undesirable substances (such as processing contaminants like acrylamide, certain polycyclic aromatic hydrocarbons) in food.
4.5.2 In the Survey, data were collected on the cooking methods of food items consumed by the respondents (Table 4.4).

Table 4.4 List of cooking methods pre-defined in the HKDiet System

| No. | Cooking method |
| ---: | :--- |
| 1 | Ready-to-eat / consumed as raw |
| 2 | Cooked in water |
| 3 | Steamed / double-boiled |
| 4 | Stewed / braised |
| 5 | Stir-fried |
| 6 | Pan-fried |
| 7 | Deep-fried |
| 8 | Baked / roasted |
| 9 | Toasted |
| 10 | Barbecued / grilled |
| 11 | Microwave-cooked |
| 12 | Others |

4.5.3 It may be noted that out of the total daily consumption amount of the relevant food groups, vegetables were mostly cooked in water (44.5\%), followed by stir-frying ( $34.9 \%$ ); meat was mostly cooked in water ( $29.3 \%$ ), followed by steaming/double boiling ( $21.5 \%$ ); poultry was mostly stewed/braised (22.8\%), followed by pan-frying ( $17.8 \%$ ); fish was mostly steamed/double boiled (47.2\%); egg and egg products were mostly stir-fried ( $31.4 \%$ ), followed by pan-frying ( $24.7 \%$ ) and cooked in water (22.7\%).

## V. Food Consumption Information from Food Frequency Questionnaire

### 5.1 Coverage of food items

5.1.1 Apart from the food items consumed in 24 HDR , the respondents' consumption of the following categories of selected food items over the past 12 months prior to the interview was collected via the FFQ:

- 25 selected food items of special interest for food safety/risk assessment
- 5 seasonal/festive food items available all year round
- 6 seasonal/festive food items only available when in season or during festive period
5.1.2 The purpose of the FFQ assessment is to provide weighted estimates of reported consumption quantities of 36 selected food items, some of which are of special interest for food safety/risk assessment whilst some are seasonal or festive foods which may be less likely to be captured from the 24 HDR interviews.
5.1.3 It should be noted that some respondents were unable to recall whether the selected food items had been consumed and/or to estimate the frequency and the amount consumed over the past 12 months prior to the interview. These responses were treated as missing values. As for those consumers who were able to report the amounts consumed, the accuracy of the information provided would likely be cruder than those amounts reported in the 24 HDR interviews. Hence, readers should be very careful in using the statistics compiled from the FFQ.

### 5.2 Food consumption data from FFQ

5.2.1 Table A. 5 in Annex presents the distribution of daily food intake of the 36 selected food items by all respondents and consumers, over the past 12 months prior to the interview. The daily food intake of individual consumers was computed by dividing the total intake by the relevant number of days. For seasonal/festive foods, the relevant number of days was the number of days in the peak/non-peak seasons.
5.2.2 Among all food items, some of them were consumed by more than half of the respondents over the past 12 months prior to the interview. These include seaweeds, seaweed (pre-packed, snack type), Chinese New Year pudding, glutinous rice dumplings, longans, lychees and baked mooncake.

## VI. Discussion and Conclusion

### 6.1 Overall achievement and outcomes of the Survey

6.1.1 This is the second population-based Food Consumption Survey in Hong Kong, and the updated food consumption data and relevant information such as the anthropometric data and demographic information of 3752 respondents were collected. A specifically designed computer program, the HKDiet System, was developed and used by the interviewers to collect data in the field through electronic means. The HKDiet System incorporated necessary research tools such as the $24 \mathrm{HDR}, \mathrm{FFQ}$ and the relevant interview questions, as well as built-in quality assurance checking at different points aiming to minimise errors during data collection.
6.1.2 The food consumption data from the respondents were collected and analysed, and the main findings are presented in this report. It provides the updated information on the food consumption of the Hong Kong population, which is crucial in conducting risk assessment to evaluate food safety risks scientifically and to provide substantiation of any new regulatory measures to control the existing or emerging food safety risks in the local context. In addition, the information collected on the sex and age of the respondents will facilitate the conduct of analysis of food consumption among different population subgroups, while the information collected on the body weight of the respondents will facilitate the conduct of quantitative evaluation of the population's exposure to hazards via consumption of food.

### 6.2 Key findings

## Food Consumption Information

6.2.1 Based on the information collected from the 24HDR interviews, the Survey has obtained an updated set of food consumption data comprising the average daily intake amounts of 30 food groups and 160 food subgroups consumed by the Hong Kong population. Hong Kong adults, on average, consumed a total of 1.15 kg of solid food and 1741 ml of liquid food (including water) per day. Based on the average daily food intake amount consumed by the population, the findings on some major food groups are presented as follows.
6.2.2 Cereals and grains products were consumed in the amount of $395.31 \mathrm{~g} /$ day, $61.2 \%$ ( $242.12 \mathrm{~g} /$ day) of which was from the rice subgroup. Pasta/noodle from all origins (including rice, wheat, etc.) made up another $36.4 \%$ ( $143.72 \mathrm{~g} /$ day) of the cereals and grains products group. Bakery wares and Chinese pastry is a food group closely related to cereals and grains products because the foods in the former food group contain a significant proportion of cereals and grains ingredients. Bakery wares and

Chinese pastry were consumed in the amount of $45.56 \mathrm{~g} /$ day, around $70 \%$ of which was from bread/roll ( $31.51 \mathrm{~g} /$ day ).
6.2.3 Vegetables and fruits were consumed in the amount of $202.65 \mathrm{~g} /$ day and 120.31 $\mathrm{g} /$ day respectively. Leafy vegetables and brassica vegetables contributed over half $(112.04 \mathrm{~g})$ of the daily vegetables consumption. Another $16.8 \%$ was from fruiting vegetables and squashes/gourds ( 34.05 g ). Slightly less than $10 \%(19.83 \mathrm{~g})$ was from root vegetables/tubers. Citrus fruits contributed to around one-third (41.10 $\mathrm{g} /$ day or $34.2 \%$ ) of the daily fruit consumption. Another $26.0 \%$ was from pome fruits ( $31.29 \mathrm{~g} /$ day).
6.2.4 Meat and poultry were consumed in the amount of $78.36 \mathrm{~g} /$ day and $32.12 \mathrm{~g} /$ day respectively. For the meat group, around $70 \%$ of the amount consumed was from pig other than offal ( $54.77 \mathrm{~g} /$ day $)$. Another $24 \%$ was from cattle/calf other than offal ( $18.63 \mathrm{~g} /$ day $)$. As for the poultry group, over $95 \%$ of the amount consumed was from chicken other than offal ( $30.63 \mathrm{~g} /$ day ). Fish was consumed in the amount of $43.54 \mathrm{~g} /$ day .
6.2.5 The consumption of egg and egg products was $26.44 \mathrm{~g} /$ day, more than $95 \%$ of which was from chicken eggs. Milk and dairy products were consumed in the amount of $24.86 \mathrm{~g} /$ day, of which over three-quarters ( 19.56 g or $78.7 \%$ ) was from milk, milk beverage and dried milk.
6.2.6 Regarding local favourites, dim sum (a large range of small Chinese dishes that contain various ingredients or fillings) was consumed in the amount of $48.05 \mathrm{~g} /$ day, whereas siu-mei and lo-mei (a group of mainly meat and poultry products which have been barbequed, roasted or marinated) was consumed at $15.34 \mathrm{~g} /$ day.
6.2.7 Through the use of FFQ, the Survey has also obtained food consumption data of some selected seasonal foods (e.g. longans and lychees) and festive foods (e.g. Chinese New Year pudding and baked mooncake) which might be less likely to be captured from the 24HDR interviews, as well as some other foods which were of special interest for food safety/risk assessment (e.g. raw oysters and swordfish sashimi).

### 6.3 Strengths of the Survey

6.3.1 A two-stage sampling design was adopted in the Survey. The first stage of sampling ensured that all living quarters would have an equal chance of being selected. All households within the sampled living quarters were then covered in the Survey and one respondent was selected from the each household according to the Kish grid table during the second stage of sampling. By adopting such scientific sampling method, there was no sampling bias and the probability of selecting any respondents can be computed. Subsequent weighting could then be applied to produce reliable estimates of the survey results. A pilot study was conducted to refine the research tools and the workflow of recruitment and interviews. The interviewers were systematically trained and supervised to ensure that they were competent to collect the required information with sufficient probing.
6.3.2 By adopting the two-stage sampling design, only one household member was selected from each household within the sampled living quarters, instead of all
members, despite putting an extra burden to the fieldwork operation. This can avoid the collection of similar food consumption data from all members of the same household who might share some of the meals together and in turn consume similar types of food, and such sampling design might increase the covariance of the food consumption data collected and would adversely affect the precision level of the estimates. Moreover, randomly sampling only one household member of the households enumerated rather than all household members would reduce respondent burden, while not affecting the representativeness of the sample. This approach would in most cases reduce the total interviewing time required for each household sampled, thereby increasing the likelihood of accepting the interview on the part of the households concerned.
6.3.3 The HKDiet System running on a notebook was used to collect the food consumption data. During the interview, data reported by the respondents were input into the System simultaneously, which could save time and effort for data input and processing after the interviews were completed. As the System covered a set of over 1000 recipes, the respondents did not have to provide information on the ingredients if these recipes were consumed and details of the food ingredients were unknown to the respondents, especially in cases where the food was consumed in a restaurant or prepared by someone else. Some built-in checking/ caution rules were also included in the System to remind the interviewers of the need to immediately check for possible data reporting errors.

### 6.4 Limitations of the Survey

6.4.1 The use of the data in this Survey, however, is subject to several limitations: (i) response rate; (ii) seasonal variations of food intake; and (iii) accuracy of the reported food consumption.

## Response rate

6.4.2 As commonly found in any voluntary survey, not all target respondents will agree to participate in a particular survey. Non-response produces bias only to the extent that there are differences between those who have responded and those who have not responded with regard to the topics under investigation. There is a number of factors affecting a person's willingness to respond. Those who are interested in the topics under investigation are more likely to respond. The responding behaviour of those who trust or value the study concerned and those who do not will inevitably be different. Demographic and life-style characteristics of the potential respondents will also affect their willingness to respond. ${ }^{1}$
6.4.3 It is believed that non-response may be randomly distributed if the reasons for refusal are say "not free to respond". There are also other reasons for refusal like the respondents are not interested in the subjects surveyed or do not like to participate in surveys undertaken by specific institutions or specific groups of institutions. For

[^1]such incidents, it is difficult to ascertain if the information not collected from such non-response is missing at random.
6.4.4 It was noted by researchers that non-response is inevitable. In order to ensure that the survey findings represent the whole population covered in the survey, it is necessary to estimate the non-response cases based on the data collected. The most common non-response estimation technique is the use of weight adjustment. This is to assign adjustment weights to respondents or groups of respondents that are likely to be over- or under-represented in the survey. ${ }^{2}$ The weight adjustment procedure adopted in the Survey is discussed in para. 1.6.2 above.
6.4.5 It is believed that the non-response bias, if any, arising from such incidents of nonresponse in this Survey can largely be adjusted by the weighting procedure discussed in para. 1.6 above. It may nevertheless be noted that by comparing say the district of residence of those participating in the survey with those who had refused to participate, there are slight variations when analysed by different regions of Hong Kong (namely Hong Kong Island, Kowloon East, Kowloon West, New Territories East and New Territories West). However, in the absence of information on the demographic characteristics of those who had refused to participate in the survey other than information on the district of residence and housing type, there is no basis for assessing the possible non-response bias. Thus, the weighting procedure discussed above should suffice, in the light of information available.
6.4.6 The response rate of the Survey may also be affected by a number of reasons. The duration of the interviews and the interviews being conducted on two nonconsecutive days might be factors considered by the target respondents. It is noted that not all target respondents could spare time off their busy schedule for the interviews. There was a number of respondents who had completed the Day-1 interview but refused to take part in the Day-2 interview. In order to encourage participation, $\$ 150$ supermarket coupons were given as an incentive to respondents who had completed both Day-1 and Day-2 interviews.

## Seasonal variations of food intake

6.4.7 Ideally the interviews of this Survey should be evenly distributed throughout the four quarters of the year in order to collect the representative dietary data and capture the seasonal variations in food intake in the population by $24 H D R$. In this Survey the distribution of cases in four quarters ranged from 31.6\% (April to June) to $21.5 \%$ (October to December). Although there was some degree of over- or undersampling among these four quarters of the year, it would be considered acceptable and should not have considerable impact on the general data quality collected in each of the quarters. Such difference in the number of cases across the four quarters of the year, however, might have some impact on capturing the consumption of the seasonal and/or festive foods. Nevertheless, the intake of selected seasonal food and festive foods has been captured by FFQ separately to provide supplementary information on these food items.

[^2]
## Accuracy of the reported food consumption

6.4.8 Similar to other dietary and food consumption surveys, the accuracy of the food quantification by the respondents is affected by their ability to estimate the quantity and their memory, as well as any possible self-reporting bias. Studies have also showed that under-reporting is not rare in dietary surveys. ${ }^{3,4,5,6}$
6.4.9 The local food culture of having composite dishes with multiple ingredients and sharing foods with a group of people during mealtimes would be one of the issues affecting the accuracy of the reported food consumption. Respondents were usually not expected to and probably not able to provide the recipes of the composite dishes and the quantity of the ingredients they consumed in a particular eating occasion. The consumption of some items was based on small number of respondents who consumed those items during the interview period, which as a result might be subject to greater sampling errors.
6.4.10 To minimise the imprecision of the dietary data collection process, the training on collecting dietary data and subsequent assessment was mandatory for all interviewers prior to being allowed to work in the field. The adaptation of the multiple-pass approach in the 24 HDR and the built-in prompting and checking in the HKDiet System were also in place to reduce possible self-reporting errors, to ensure subsequent probing and to remind interviewers for checking against unusual values.
